PROJECT : Predicting House Prices Using Machine Learning

Submitted By : v.Gnana prakash

Mail ID : lovelyprakash157@gmail.com

Phase-03 : Loading and Pre-Processing the Dataset

ABOUT THIS PHASE :

In this phase we need to do loading and pre-processing the datasets. Here I explain about what are the process to do this phase.

Step 1:

Import the dependencies

In this step we import the library files which are required to run this program code, like modules (numpy , pandas, sklearn , matpltlib, seaborn, XGBoost).

Step 2:

Impor ting the dataset

In this step I import California_housing dataset form the the sklearn module it is used to fetch the data and the data is used as the input of this project.

Step 3:

Loading the dataset into the pandas data frame

In this step I load my data to the pandas data frame which gives the structure of our dataset

Step 4:

Checking the number of rows and column to the dataset

In this step I check the number of rows and column to the dataset and also check any missing values in my dataset

Step 5:

Statical measure of dataset

In this step to check some stats related to my dataset like(count, mean, minimum, maximum, standard deviation).

Step 6:

Generate heat map

In this step to generate heat map to know about my dataset clearly by using the module matplotlib.pyplot

Import the dependencies

```
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
import sklearn.datasets
from sklearn.model_selection import train_test_split
from xgboost import XGBRegressor
from sklearn import metrics
```

Impoeting the california house prise dataset

```
 from sklearn.datasets import fetch_california_housing
house_price_dataset = fetch_california_housing()
```

```
print(house_price_dataset)
```

```
{'data': array([[   8.3252    ,   41.        ,    6.98412698, ...,    2.55555556,
           37.88      , -122.23      ],
        [   8.3014    ,   21.        ,    6.23813708, ...,    2.10984183,
           37.86      , -122.22      ],
        [   7.2574    ,   52.        ,    8.28813559, ...,    2.80225989,
           37.85      , -122.24      ],
        ...,
        [   1.7       ,   17.        ,    5.20554273, ...,    2.3256351 ,
           39.43      , -121.22      ],
        [   1.8672    ,   18.        ,    5.32951289, ...,    2.12320917,
           39.43      , -121.32      ],
        [   2.3886    ,   16.        ,    5.25471698, ...,    2.61698113,
           39.37      , -121.24      ]]), 'target': array([4.526, 3.585, 3.521, ..., 0.923, 0.847, 0.894]), 'frame': None, 'target_n
```

```
# loading the dataset to the Pands DataFrame
house_price_dataframe = pd.DataFrame(house_price_dataset.data, columns = house_price_dataset.feature_names)
```

```
# print first 5 rows of our DataFrame
house_price_dataframe.head()
```

underatanding various feature in the dataset

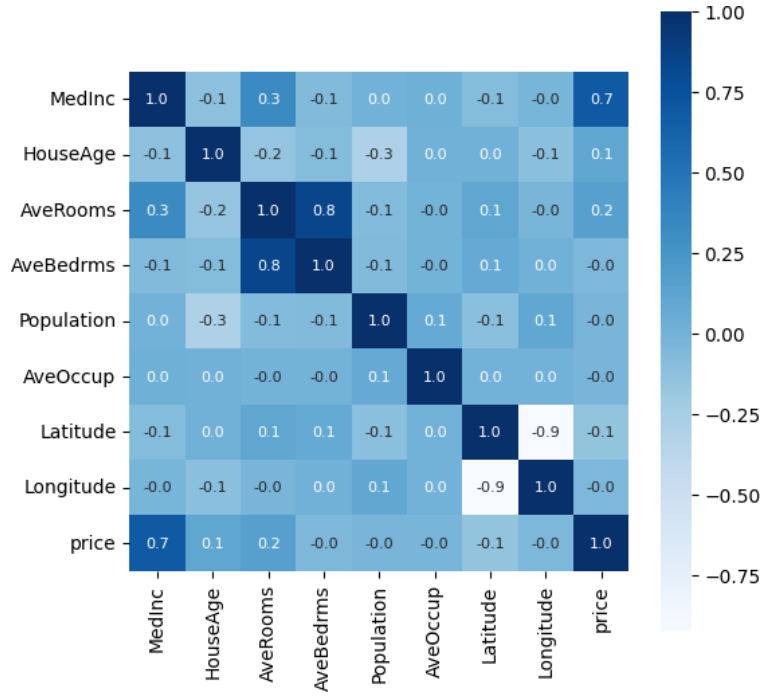
1.positive correlation 2.negative correlation

```
correlation = house_price_dataframe.corr()
```

constructing the heatmap

```
# constructing the heatmap to understand the correlation
plt.figure(figsize=(6,6))
sns.heatmap(correlation, cbar=True, square=True, fmt='.1f', annot=True, annot_kws={'size':8}, cmap='Blues')
```

```
<Axes: >
```



splitting data and target

```
X = house_price_dataframe.drop(['price'], axis=1)
Y = house_price_dataframe['price']

print(X)
print(Y)
```

```
